

EXP NO:9**DATE:10/10/24****ANALYZE DIFFERENT TYPES OF SERVERS USING WEBALIZER****Aim:**

To analyze the different types of web logs using Webalizer tool.

Procedure:

- Step 1: Download Apache web server using- dnf install httpd
- Step 2: Configure SELINUX to permissive mode
(open /etc/sysconfig/selinux Put SELINUX=permissive)
- Step 3: Start Apache web server using- systemctl start httpd.service
- Step 4: Create a directory for webalizer using - mkdir /var/www/html/webalizer
- Step 5: Install webalizer using - dnf install webalizer
- Step 6: Copy files from /var/www/usage to /var/www/html
- Step 7: Open /etc/webalizer.conf file and add the following-
 - LogFile /var/log/httpd/access_log
 - LogType clf
 - Hostname localhost
 - Output Dir /var/www/html/webalizer
- Step 8: Save it and then run webalizer
- Step 9: Open in web browser http://localhost/webalizer

WEBALIZER:

#Instructions to install, configure and run Webalizer on Fedora
#Enter the root password after typing su
Su

Step 1:Download Apache web server using- dnf install httpd

dnf install httpd

Step 2:Configure SELINUX to permissive mode

(open /etc/sysconfig/selinux Put SELINUX=permissive)
vi /etc/sysconfig/selinux
Put SELINUX=permissive instead of enforcing

Step 3: Start Apache web server using- systemctl start httpd.service

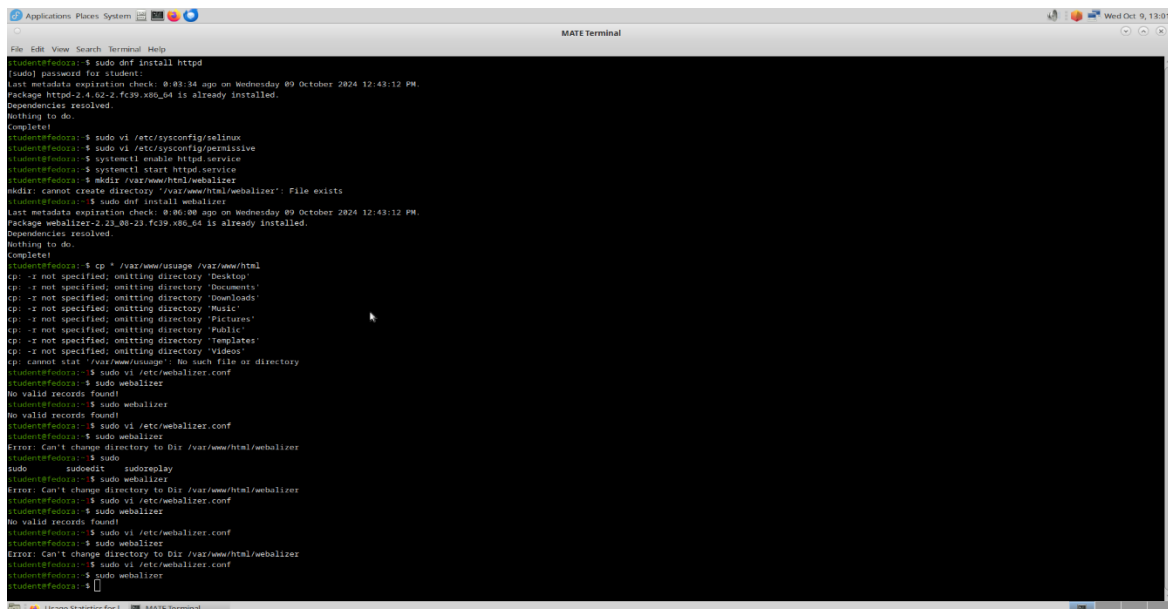

```
systemctl enable httpd.service  
systemctl start httpd.service
```

Step 4: Create a directory for webalizer using - mkdir
`mkdir /var/www/html/webalizer`

Step 5: Install webalizer using - dnf install webalizer
`dnf install webalizer`

Step 6: Copy files from /var/www/usage to /var/www/html
`cp -r /var/www/usage /var/www/html`

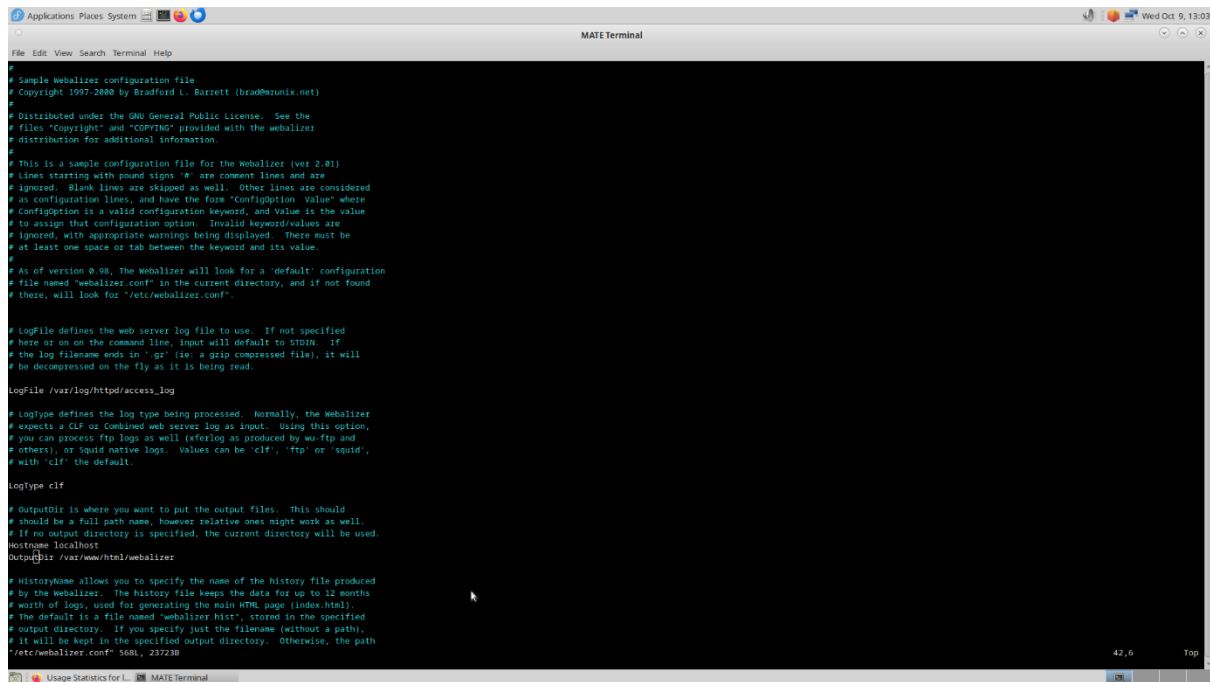

Step 7: Open /etc/webalizer.conf file and add the following-
`vi /etc/webalizer.conf`

```
student@fedora:~$ sudo dnf install httpd  
Last metadata expiration check: 0:01:34 ago on Wednesday 09 October 2024 12:43:12 PM.  
Package httpd-2.4.62-2.fc39.x86_64 is already installed.  
Dependencies resolved.  
Nothing to do.  
Complete!  
student@fedora:~$ sudo vi /etc/sysconfig/selinux  
student@fedora:~$ sudo vi /etc/sysconfig/permissions  
student@fedora:~$ systemctl enable httpd.service  
student@fedora:~$ systemctl start httpd.service  
student@fedora:~$ mkdir /var/www/html/webalizer  
mkdir: cannot create directory '/var/www/html/webalizer': File exists  
student@fedora:~$ sudo dnf install webalizer  
Last metadata expiration check: 0:00:08 ago on Wednesday 09 October 2024 12:43:12 PM.  
Package webalizer-2.23.0-2.fc39.x86_64 is already installed.  
Dependencies resolved.  
Nothing to do.  
Complete!

# Sample Webalizer configuration file
# Copyright 1997-2000 by Bradford L. Barrett (brad@sunix.net)
#
# Distributed under the GNU General Public License. See the
# files "Copyright" and "COPYING" provided with the webalizer
# distribution for additional information.
#
# This is a sample configuration file for the Webalizer (ver 2.01)
# Lines starting with pound signs '#' are comment lines and are
# ignored. Blank lines are skipped as well. Other lines are considered
# as configuration lines, and have the form 'Configuration keyword value' where
# Configuration is a valid configuration keyword, and value is the value
# to assign that configuration option. Invalid keyword/values are
# ignored, with appropriate warnings being displayed. There must be
# at least one space or tab between the keyword and its value.
#
# As of version 0.98, The Webalizer will look for a 'default' configuration
# file named 'webalizer.conf' in the current directory, and if not found
# there, will look for '/etc/webalizer.conf'.

# logfile defines the web server log file to use. If not specified
# here or on the command line, input will default to stdin. If
# the log filename ends in '.gz' (ie: a gzip compressed file), it will
# be decompressed on the fly as it is being read.

logfile /var/log/httpd/access_log

# Logtype defines the log type being processed. Normally, the webalizer
# expects a CLF or Combined web server log as input. Using this option,
# you can process ftp logs as well (xferlog as produced by vs-ftp and
# others), or squid native logs. Values can be 'clf', 'ftp' or 'squid',
# with 'clf' the default.

logtype clf

# OutputDir is where you want to put the output files. This should
# should be a full path name, however relative ones might work as well.
# If no output directory is specified, the current directory will be used.
OutputDir /var/www/html/webalizer

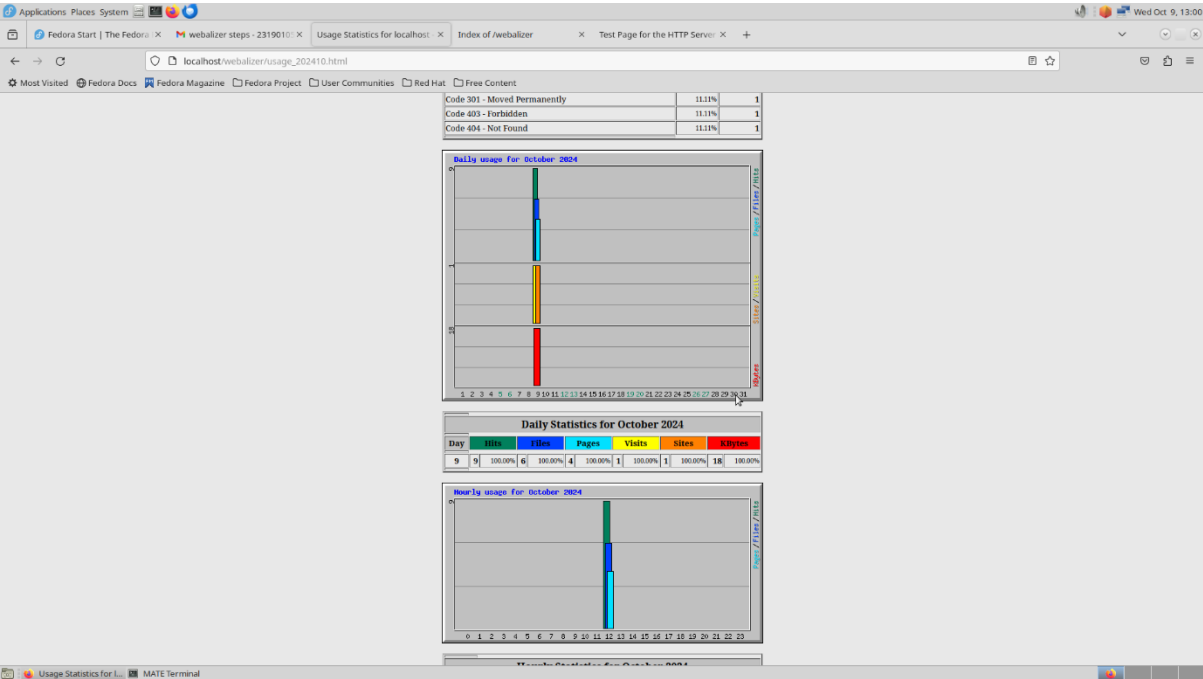

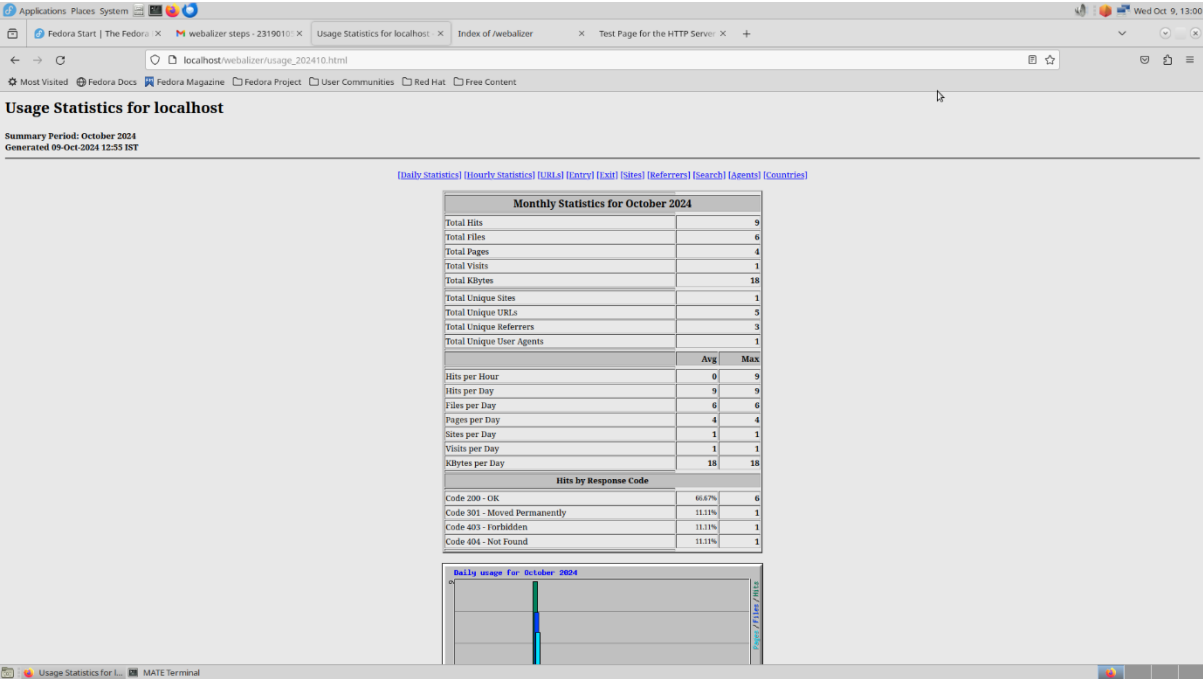

# HistoryName allows you to specify the name of the history file produced
# by the Webalizer. The history file keeps the data for up to 12 months
# worth of logs, used for generating the main HTML page (index.html).
# The default is a file named 'webalizer.hist', stored in the specified
# output directory. If you specify just the filename (without a path),
# it will be kept in the specified output directory. Otherwise, the path
# "/etc/webalizer.conf" 568L, 2372B
```

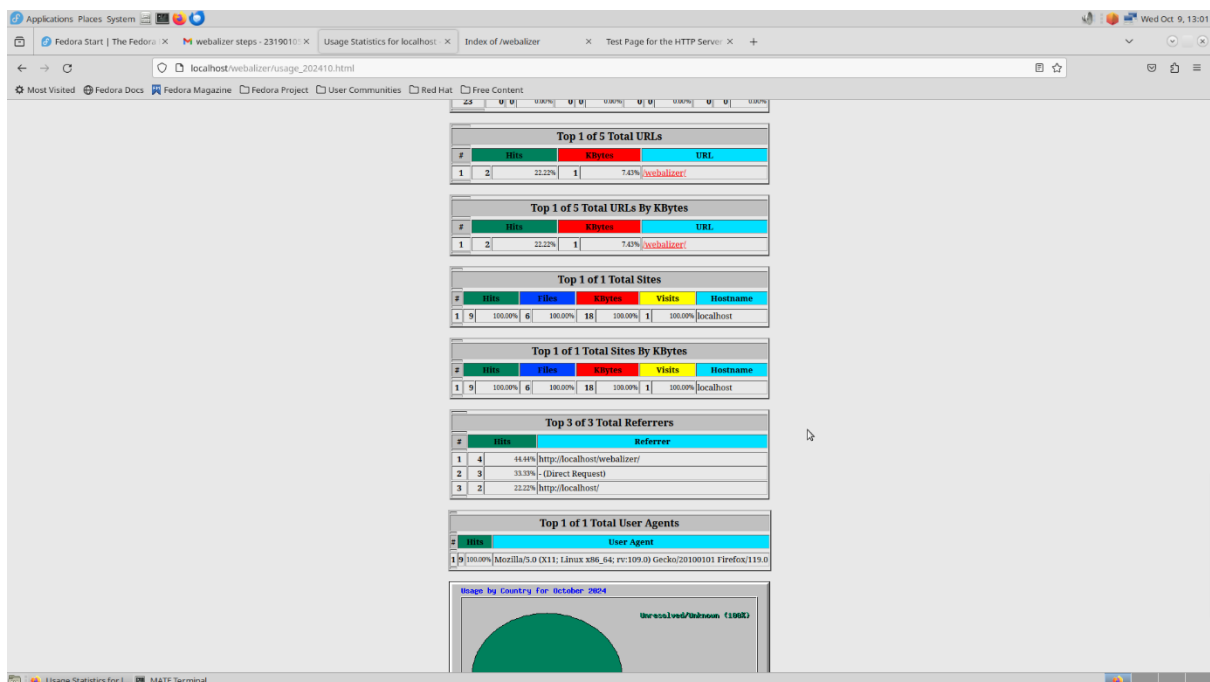

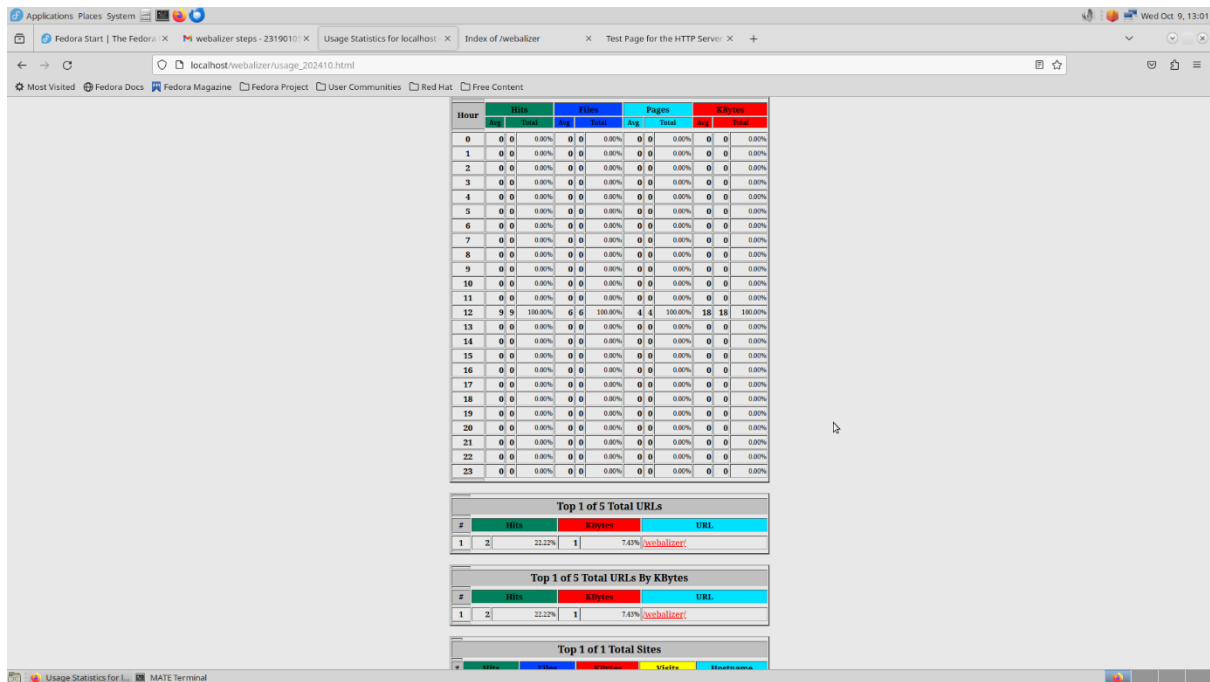

Step 9: Open in web browser <http://localhost/webalizer>

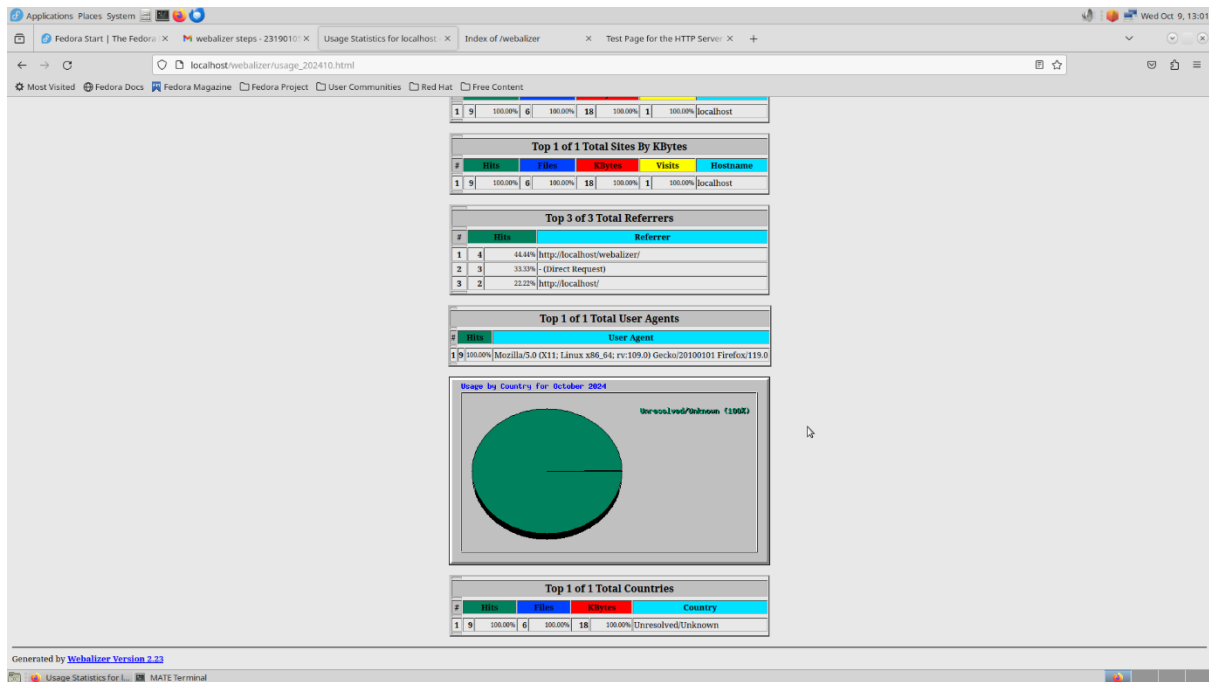

Open in browser <http://localhost/webalizer>
Click Oct.2023 link to get the report for this month

Before running webalizer, restart httpd server by typing-
systemctl restart httpd.service.

OUTPUT:

RESULT:

Apache server using webalizer tools is analyzed.
