EXP NO:11B <u>ARITHMETIC OPERATION USING RPC</u>

AIM:

To develop a simple calculator using XMLRPC.

ALGORITHM:

Server.py

- 1. Import XMLRPCServer package
- 2. Define functions for addition, subtraction, multiplication, division and modulus
- 3. Initialize simple XMLRPCServer with IP address (or localhost) and port number
- 4. Register the functions add, sub, mul, div and mod with the server
- 5. Handle the request
- 6. Close the connection.

Client.py

- 1. Import XMLRPC Client package
- 2. Define functions for addition, subtraction, multiplication, division and modulus
- 3. Initialize simple XMLRPC Client with Server IP address (or localhost) and port number
- 4. Get two numbers a and b for arithmetic operations
- 5. Call add() function and print the result
- 6. Call sub() function and print the result
- 7. Call mul() function and print the result
- 8. Call div() function and print the result
- 9. Call mod() function and print the result

10. Close the connection

Sample Code for Arithmetic operations using RPC XML RPC PROGRAM- SERVER SIDE:

```
from xmlrpc.server import SimpleXMLRPCServer
# Define a function def is even(n): return n % 2
== 0 def add(a,b): return a+b def sub(a,b): return
a-b def factorial(n): factorial=1 for i in
range(1,n+1): factorial = factorial*i return
factorial def multiply(x, y): return x * y def
divide(x, y): return x // y # Create server server =
SimpleXMLRPCServer(("localhost", 8000))
print("Listening on port 8000...") # Register a
function under a different name
server.register function(is even, "is even")
server.register function(add, "add")
server.register function(sub, "sub")
server.register function(factorial,"factorial")
#server.register function(factorial,"factorial")
server.register function(multiply, 'multiply')
server.register function(divide, 'divide') # Run the
server's main loop server.serve forever()
```

231901042 RITHIKA BASKAR

```
🥏 XML RPC PROGRAM- SERVER SIDE.py 🗡 🛛 🖓 XML RPC PROGRAM- CLIENT SIDE.py
       from xmlrpc.server import SimpleXMLRPCServer
      # Define a function
      def is_even(n): 1usage
       return n % 2 == 0
      def add(a,b): 1 usage
       return a+b
      def sub(a,b): 1 usage
       return a-b
      def factorial(n): 1 usage
       factorial=1
       for i in range(1,n+1):
           factorial = factorial*i
       return factorial
       def multiply(x, y): 1usage
       return x * y
      d⊌f divide(x, y): 1usage
           return x // y
17
      # Create server
      server = SimpleXMLRPCServer(("localhost", 8000))
      print("Listening on port 8000...")
      # Register a function under a different name
       server.register_function(is_even, name: "is_even")
      server.register_function(add, name: "add")
      server.register_function(sub, name: "sub")
      server.register_function(factorial, name: "factorial")
      #server.register_function(factorial, "factorial")
      server.register_function(multiply, name: 'multiply')
      server.register_function(divide, name: 'divide')
      # Run the server's main loop
      server.serve_forever()
```

XML RPC PROGRAM- CLIENT SIDE:

import xmlrpc.client

proxy= xmlrpc.client.ServerProxy('http://localhost:8000/') # local server for i in range(5):

231901042 RITHIKA BASKAR

```
a=int(input("Enter a number:"))
b=int(input("Enter b number:"))

print("%d is even?: %d" % (a, (proxy.is_even(a)))) #access XML-RPC server
through proxy print("addition of given number is %d "%((proxy.add(a,b))))

print("sub of given number is %d "%((proxy.sub(a,b)))) print("factorial: %d"
%((proxy.factorial(a)))) print("factorial: %d" %((proxy.factorial(b))))

print("Multiplication of 2 numbers is %d" %(proxy.multiply(a,b)))

print("Division of 2 numbers is %d" %(proxy.divide(a,b)))
```

```
import xmlrpc.client
proxy= xmlrpc.client.ServerProxy('http://localhost:8000/') # local server for i in range(5):
a=int(input("Enter a number:"))
b=int(input("Enter b number:"))
print("%d is even?: %d" % (a, (proxy.is_even(a)))) #access XML-RPC server through proxy
print("addition of given number is %d "%((proxy.add(a,b))))
print("sub of given number is %d "%((proxy.sub(a,b))))
print("factorial: %d" %((proxy.factorial(a))))
print("factorial: %d" %((proxy.factorial(b))))
print("Multiplication of 2 numbers is %d"%(proxy.multiply(a,b)))
print("Division of 2 numbers is %d"%(proxy.divide(a,b)))
```

OUTPUT:

For server:

For client:

231901042	RITHIKA BASKAR
RESULT:	
A simple calculator was designed using XMLRPC.
